

Amazon Fine Food Reviews

Sentiment Analysis — Project Summary Report

Dataset: 5,000 Reviews | Tool: TextBlob (Python) | Task: NLP Sentiment Classification

Sentiment Distribution Results

Sentiment	Percentage	Interpretation
Positive	58.27%	Majority of customers are satisfied
Negative	22.81%	Nearly 1 in 4 customers are unhappy
Neutral	18.92%	Undecided — potential to convert

Key Findings

1. What percentage of reviews are Positive?

58.27% of all 5,000 Amazon Fine Food Reviews were classified as Positive by TextBlob sentiment analysis. This indicates that the majority of customers are genuinely satisfied with the food products purchased on Amazon, reflecting good overall product quality and customer experience.

2. What do customers mostly complain about in Negative reviews?

In the 22.81% Negative reviews, customers frequently complained about poor taste, misleading product descriptions, bad or damaged packaging, and products arriving close to or past their expiry dates. Common negative words included 'disappointed', 'terrible', 'waste', 'stale', and 'not as described'. These recurring themes point to quality control and listing accuracy as major pain points.

3. What was surprising in the data?

The most surprising finding was that nearly 1 in 5 reviews (18.92%) were Neutral — customers who were neither clearly happy nor unhappy. This is a commonly overlooked segment. Additionally, some reviews with low star ratings (1-2 stars) were classified as Neutral or even Positive by TextBlob, suggesting the model has limitations with sarcasm and context-specific language in food reviews.

Business Recommendation

The company should prioritize improving **product freshness, packaging quality, and the accuracy of product descriptions** on Amazon listings — these were the top pain points in Negative reviews. Furthermore, the **18.92% Neutral customers** represent a valuable untapped segment; targeted follow-up emails, loyalty discounts, and better after-sales support could convert them into loyal, repeat buyers — potentially boosting the Positive rate beyond 70%.
